In this Handbook of Experimental Pharmacology on "High Density Lipoproteins" from biological understanding to clinical exploitation contributing authors (members of COST Action BM0904/HDLnet) summarize in more than 20 chapters our current knowledge on the structure, function, metabolism and regulation of HDL in health and several diseases as well as the status of past and ongoing attempts of therapeutic exploitation.

High-density lipoproteins are one of the five major groups of lipoproteins. Lipoproteins are complex particles composed of multiple proteins which transport all fat molecules around the body within the water outside cells. They are typically composed of 80-100 proteins per particle and transporting up to hundreds of fat molecules per particle.

High-density lipoprotein (HDL) is the most complex class of lipoproteins. HDL is comprised of several subclasses that are different in size, protein and lipid composition, physiological functions, and pathophysiological significance.

### **High-Density Lipoprotein - an overview | ScienceDirect Topics**

High-density lipoproteins (HDL) form a class of lipoproteins, varying somewhat in their size (8-11 nm in diameter) and contents, that carry cholesterol from the body's tissues to the liver.

### **High density lipoprotein - ScienceDaily**

Cholesterol travels through the blood on proteins called lipoproteins. Two types of lipoproteins carry cholesterol throughout the body: LDL (low-density lipoprotein), sometimes called "bad" cholesterol, makes up most of your body's cholesterol. High levels of LDL cholesterol raise your risk for heart disease and stroke.

### **LDL & HDL: Good & Bad Cholesterol | cdc.gov**

There are two main types of cholesterol: HDL (good) cholesterol and LDL (bad) cholesterol: HDL stands for high-density lipoproteins. It is called the "good" cholesterol because it carries... LDL stands for low-density lipoproteins. It is called the "bad" cholesterol because...

In most cases, cholesterol utilized as substrate is obtained from high or low density lipoproteins (HDL, LDL) rather than synthesized de novo from acetate [6, 7].

Biogenesis of high-density lipoproteins (HDL) is coupled to the transmembrane protein, ATP-binding cassette transporter A1 (ABCA1), which transports phospholipid (PL) from the inner to the outer ...

### **The Structure of Apolipoprotein A-I in High Density**

High density lipoprotein (HDL) possesses important anti-atherogenic properties and this review addresses the molecular mechanisms underlying these functions. The structures and cholesterol transport abilities of HDL particles are determined by the properties of their exchangeable apolipoprotein (apo ...

The classification into chylomicrons (CM), very low-density (VLDL), low-density (LDL), and high-density (HDL) lipoproteins is based on their relative contents of protein and lipid that determine the densities of these lipoprotein classes.
